

Perfect Choice for Babesiosis & Anaplasmosis

Imipro

INJECTION

Perfect Choice for Babesiosis & Anaplasmosis

Imipro INJECTION

Composition :

Each ml contains
Imidocarb dipropionate 120 mg

Indications :

Imipro injection is indicated for the treatment and prevention of babesiosis in cattle, sheep, horses and dogs, anaplasmosis in cattle and ehrlichiosis in dogs.

Pharmacological Properties

Imipro injection acts by combining with nucleic acids of DNA in susceptible organisms, causing the DNA to unwind and denature. This damage to DNA inhibits cellular repair and replication in susceptible organisms. The drug is rapidly absorbed after intramuscular administration with peak plasma concentration achieved in 30-mins. The initial excretion through urine is rapid. The plasma half-life lengthened with time following treatment, being 45-55 days by 60 days after second dose.

Dosage and Administration

Imipro injection can be injected by Subcutaneous or Intramuscular route. Intramuscular route is recommended in horses and dogs. It is advised to screen the blood before and after the treatment for the presence of parasite.

Animals	Babesiosis (Per 100 kg)	Anaplasmosis (Per 100 kg)
Cattle	1 ml	2.5 ml
Sheep / Goat	1 ml	
Horse / Donkey	2 ml	
Dogs	2.5 ml	

Precautions :

- Do not inject intravenously.
- Withdrawal time, **Meat** : 28 days, **Milk** : 3 days
- A painful inflammatory action may be seen at the site of injection.
- Risk versus benefit should be considered before using in animals with impaired lung, liver or kidney.
- Do not use this drug along with cholinesterase-inhibiting drugs.
- Store below 25°C in a cool and dry place.

Packing : 10 ml, 100 ml.
